

HY-GAIN 623
20KC SLIDER AND POWER INCREASE

- (1) Remove bottom and top cover and locate range limiting resistors on fine tune control.
- (2) Solder jumper wires across them as shown.
- (3) Locate the wire in front of the power transformer and move it to the empty pin directly behind it, as shown.

NOTE: This modification will result in 20KC coverage of the fine tune control and a power output on SSB of about 20 watts.
