

# MODIFICATION OF DEMCO STAR II AND SUPER SATELLITE II

To get channels 44 to 56 on channel 28 to 40 positions, add 100K resistor and switch as shown.

To get 200KC down from normal 40 channels, replace 36.960 crystal with crystal "DD". (36.760)

This is a tube type transceiver and may require realignment when shifting more than 200KC from original design. Capable of 248 channel spread.
